The Refrigerated Tank Task Group will prepare a new API standard on the materials, design, and construction of above-ground vertical cylindrical storage tank systems for refrigerated liquefied gases. The tank system includes the primary storage tank, secondary containment structures, and other components within or part of the storage tank or containment structure. The new standard will reference rather than replace the detailed requirements in API 620 (existing) and ACI 376 (in preparation). As a minimum the new standard will include provisions for single, double and full containment storage tanks. Additionally, the task group will prepare the necessary revisions to API 620 to coordinate it with the new API standard and expand coverage of other specialized aspects of refrigerated tanks such as insulation and post-construction activities.
